Loading from 2014-07-01 - 2014-08-01

Data taken from DMF, untarred, unzipped and renamed back to original file names

It was noted that BOTH TEI 42i's lost their internal Mass Flow Meters. This was not consequential as the inlet has much better Mass Flow Controllers.

The NO_x photolysis cell began working this month (to the Mentor's great surprise) albeit at lower efficiency (0.22). NO₂ Data appear valid but should be viewed with higher uncertainties than usual.

Ambient NO and NO_y data appear reasonable.

○ - NO Channel ; △ - NO_x Channel; □ - NO_y Channel
 Zero Air Equivalent Signal (ppbv)
 S.A. #1 (calibrated sig/dilution conc: [SA#1] = 20.8 ppbv)
 S.A. #2 (calibrated sig/dilution conc: [SA#2] = 82.86 ppbv)
 GPT + SA #2 (NO: frac titr., NO_x: Photol. C.E. (nom=0.22), NO_y: Mo C.E. (nom=1.03))
 HNO₃ cal. (calibrated sig/pern conc: [HNO₃] = 68.9 ppbv)
